

Health Technology For Doctors and Medical Practitioners

*Engaging patients with health information and
treatment-related data in time.*

www.reanfoundation.org_____

Mobile health platforms are removing barriers to provide healthcare solutions in new and innovative ways to remote populations. Health technology enables doctors and medical practitioners to diagnose and treat patients without the need of their physical presence. Technology is also enabling complete transparency in the interaction between healthcare providers and patients by allowing them to freely access health records and medical history.

Challenges Faced

- ▶ Difficulty in reaching patients in remote areas leads to limited access to healthcare.
- ▶ Too much time is used up in educating patients on right nutrition, symptom identification, etc..
- ▶ Existing systems lack efficiency required to check and save patient reports, racking vitals, etc.
- ▶ Cost of travel increases by visiting each patient and providing care in person.
- ▶ Current systems focus on episodic nature of care, not preventive.

Benefits of Using Mobile Health Technology

- ▶ Virtual health platforms extend doctors' reach to patients in remote areas.
- ▶ Medical support can be provided virtually through videos, chat, etc. in many cases, reducing the need to visit the patients in person.
- ▶ Time can be managed more effectively, improving productivity of medical practitioners.
- ▶ Virtual channels can be effectively used to access and check health records and monitor vitals.
- ▶ Improved focus on continuous care and support helps prevent extreme illness episodes.
